

BussiPro promotes eco-friendly operations

Preventive maintenance plus appropriate spare parts equals fewer back-up vehicles and less unnecessary driving. This is the formula that BussiPro applies to helping its contract customers use their bus fleet more efficiently.

Through vehicle life cycle management and careful planning of maintenance and repair operations, companies can ensure that their vehicles are on the road – generating income – rather than stuck at the depot, waiting for spare parts. Under a preventive maintenance plan, parts subjected to wear and tear are replaced before they actually get broken – after all, failures tend to happen in the wrong place at the wrong time. In addition, when such a part breaks suddenly it is often fixed as a temporary measure and another visit to the repair shop is required later on.

With good planning and preventive maintenance, the environmental burden generated by operations is reduced as unnecessary driving is minimised, the need for towing is cut, and the risk of hazardous substances leaking into the environment decreases.

Our training provides your staff with the ability to assess whether it is beneficial to use eco-friendly factory-repaired spare parts and second-hand parts inspected by BussiPro.

Our concept is aimed at making the bus company's operations more efficient and creating savings. This benefits not only the operators involved in the production of the service but also the environment.
